PUBLIC ANNOUCEMENT

Due to increase in looping, mainline extensions and the new water storage tank projects and the fact the District has not chlorinated the water system in many years, the District will be chlorinating the system for a period of two weeks. Most of the chlorine will be flushed from the water system; the flushing will occur on dead-end lines. The chlorination will help clean the water system and extend the health of the system. This process may begin as early as Monday, November 23rd, 2020. This should not change the taste or appearance of the water quality for most, but it may for some customers with more sensitive pallets. For them, the District apologizes for the inconvenience. The chlorine should not be detectable by taste or smell. Only small amounts will be used. The chlorination will occur at the Larix Well site. For educational purposes and to provide the District technicians knowledge and skills in case of emergency situations, the District intends to chlorinate for one week annually at the end of every irrigation season in the future. This will provide our technicians the experience necessary to execute a quick and successful chlorination process to keep the District safe in case of emergencies.
